

Irrrespective of the industry and the domain you are employed in, security always assumes precedence in your operations. Over the course of the past few years, such has been the extent and volume of deliberation centring around this particular topic that, now, there stands an industry that is exclusively dedicated to security and its various channels. In the current scheme of things, we are privy to hundreds and thousands of standard practices that shed light on securing the various networks and systems around us. As users of FreeBSD, thus, you must familiarise yourself with the nuances of its security system to shield yourself from unprecedented attacks and malicious intruders effectively.

In a FreeBSD system, security assumes top priority

At the outset, it is essential to bear in mind that the FreeBSD system comes inherently associated with numerous layers of security and allows users to incorporate various third party utilities to boost the system's security. Security must be everyone's topmost priority. A vulnerable and compromisable entry point within the system enables intruders to access critical and vital data and gives them the liberty of wreaking havoc upon the entire network.

The CIA triad

The CIA triad, which stands for Confidentiality, Integrity, and the Availability of information systems, is among the core principles of information
