

security out there. It is treated as a bedrock philosophy of computer and system security that provides customers and users with the necessary assurance that their data is being protected at all times. Let us take the example of a credit card arrangement to gain an in-depth understanding of the CIA triad. When using a credit card, a customer expects their credit card information to remain secured and protected at all times, thus bringing the “Confidentiality” angle into the picture. Besides their transactions, they would expect their orders to remain unchanged and constant behind the scenes. This highlights the “Integrity” aspect of the triad. Lastly, a credit card user would expect to have access to their order information at all times, thus shifting focus onto the “Availability” side of things.

The core of information security is constituted by the CIA triad

To effectively issue CIA, most security professionals resort to applying defence in depth strategy. The motive behind implementing this strategy is to include multiple layers of security within the system. Subsequently, this keeps the entire system and arrangement from collapsing in the event of any single constituent layer’s failure. For instance, a system administrator must not deem their system or network secure after turning on the firewall feature. They must also thoroughly look into auditing accounts’ matters,
