

Keeping the components of the base system updated

Paths starting with an entry named `UpdateIfUnmodified`

Any update of the statement is possible only when the file contents are updated

User modified (unless there has been a merger for changes;).

`UpdateIfUnmodified /etc/ /var/ /root/ /.cshrc /profile`

The option mentioned above will result in the update of the config files in the mentioned directories. Whenever there are any modifications for users, such changes prevent the automatic update. Another way is to `KeepModifiedMetadata`, resulting in instructing the `FreeBSD-update` to save the changes while merging.

In case of upgradation to the new release of FreeBSD, files which match `MergeChanges`

the local changes will be merged into the newly released version.

`MergeChanges /etc/ /var/named/etc/ /boot/device.hints`

The file merger process involves several patches that are similar to the `mergemaster`, though with lesser options. The merges can either be accepted or cause the `FreeBSD-update` to abort. Where in doubt, you can back up and accept the other merges.

Note: The `mergemaster` utility is a Bourne shell script that will help you update various files and configurations associated with FreeBSD.
