

Updating the documentation set

Having an updated Documentation set is an integral part of the FreeBSD operating system. An up-to-date version of the FreeBSD documentation is readily available on the FreeBSD web site.

Documentation can either be updated from source or ports.

Rebuilding the FreeBSD documentation from the source requires a collection of tools that are not part of the FreeBSD base system. You can install the necessary tools from the `textproc/docproj` package or port developed by the FreeBSD Documentation Project.

For updating documentation from ports, this method is also supported by a set of documentation ports and packages updated by the `{a.doceng}` monthly. They are listed in the FreeBSD Ports Collection, under the `docs` category (<http://www.freshports.org/docs/>).
