Installing Stuff

Let's learn how to install third-party software in a FreeBSD system

FreeBSD allows customisation on more than one front. Among the major selling points of FreeBSD is that it contains multiple inbuilt tools for carrying out various system tasks. However, as with any operating system, inbuilt tools alone cannot serve all purposes. You need third party software to carry out a host of different specialist tasks.

Thankfully, FreeBSD allows users to download third-party software through specific routes. You can install third-party software from source or pre-built binaries. You also have the choice to either install the software from locally stored media or from a network to which you have connected.

This chapter primarily deals with the installation of third-party software in FreeBSD. Along the way, you will learn various terms and methods that you will encounter at each step of the installation process.
