X-Window System

This system is an open-source computer software system that can be cross-platform as well. It provides a Graphic User Interface in a distributed environment.

It is used mainly for Unix variants; X window system versions are available for other operating systems like Windows and MS-DOS. Some features of this system are network transparency, customisable graphical proficiencies, and the capacity to link to different networks. This system was first invented in 1984, and it was a part of project Athena. It was a collaboration between Stanford University and
