

etry, and graphic properties of X display. The window manager can change the size and position of windows on display.

- An X client is a program that interacts with the X server and utilises the X protocol. Some examples of X clients are Xterm, Xclock, Xcalc, etc. X controls its windows in a hierarchical structure. The covered area that fills the whole screen is called the root window. The X client windows are the ones that are displayed on top of the root window and are often defined as the children of the root.
- A desktop environment is a suite that performs basic desktop tasks. KDE and GNOME are some of the basic desktop environments. This includes basic applications like office suites, games, web browsers, etc.
- The window manager controls the focus policy. It is in charge of the mouse focus policy. It gives the user a way to choose which window is receiving keystrokes and indicates which is active.
- One type of focus policy is called 'click to focus'. In this, a window is active when you click it with a mouse.
- As the mouse moves over the root window in 'sloppy focus', the current or recently used window has the focus. In this, the focus changes when the pointer moves towards a new window.
