Keyboard

code when it is released. In this way, the computer detects how long you press the button and what the combination is.

To understand the combination and which button corresponds to which letter or symbol, they follow a keyboard map. The most popular one is the QWERTY keypad, which many tech companies use when they build their laptops and desktops. Most keyboards have a simple microprocessor and a USB interface with 3 LEDs to indicate keyboard status like caps lock, num lock, etc.

You can use this layout for setting a keyboard layout for French:

Section “InputClass”

Identifier	“KeyboardDefaults”
MatchIsKeyboard	“on”
Option	“XkbLayout” “fr”

EndSection

And for multiple layouts for other languages and formats like US English, Spanish, etc.:

Section “InputClass”

Identifier	“All Keyboards”
MatchIsKeyboard	“yes”
Option	“XkbLayout” “us, es, ua”

EndSection

Monitors

Monitors can be of two types: CRT and LCD, i.e. Cathode Ray Tube and Liquid Crystal Display.

CRT is older and used a large amount of energy to create electron beams. It has its benefits, but it’s immense size, excess energy use, X-ray formation, and radiation concerns had led people to switch to LCD when the technology came into existence.
