

or add a `FontPath` line to `xorg.conf`.

Gimp, Libre Office, and other X applications must recognise TrueType fonts. Both tiny as well as big fonts look better in these applications thanks to TrueType style smoothing of edges.

How to setup XDM

XDM is a part of the X window system, and it is set up in `/etc/inittab`. The information you need to customise is found on the main page. To setup XDM during bootup, change the `initdefault` level to 5 and add the following lines to `/etc/inittab`:

```
# Run xdm as a separate service
x:5:respawn:/usr/X11R6/bin/xdm -nodaemon
```

If your system is Linux – PAM then you have to create a PAM entry for XDM setup. You can do this by creating a duplicate copy of the login entry using this:

```
cp -v /etc/pam.d/login /etc/pam.d/xdm
```

How to install desktop environments

As we talked about the type of desktop environment, GNOME and KDE are the most popular ones.

GNOME is an easy to handle and user-friendly desktop environment. There is a basic panel for applications and displaying status.

You can install GNOME from this package:

```
# pkg install gnome3
```

GNOME is a large application, so it will take time to compile. To build GNOME from ports, you can use the following codes:

```
# cd /usr/ports/x11/gnome3
# make install clean
```

KDE is also a user-friendly desktop environment. The display is pretty standard and basic.

You can install KDE from this package:

```
# pkg install x11/kde5
```

To build KDS from ports, you can use the following codes:

```
# cd /usr/ports/x11/kde5
# make install clean
```

Conclusion

The X Window system is one of the oldest systems used in Linux/
