

MSDOS and windows. As it is an old system, it is not used much nowadays. Many critics say that the latest versions of the X window system don't use graphics as much as they can. There have been multiple developments and different versions of the X window system, but they cannot sell it well. It is not doing good commercially. Yet many tech companies and users prefer to use this system for its customisable nature and capability to link different networks together. One of the significant drawbacks of this system is not everything works in Apple Mac as it is solely designed for Windows/Linux and MSDOS. With more users using Mac software, the X window system's target audience is significantly reduced. The X window system needs to improve upon their versions so that they can sell their system efficiently.
