

And in this digital age, desktops are one of the foremost requirements for the modern workforce. Every user is using applications to breeze through their daily activities of using the internet, checking documents, writing, building presentations, etc.

This chapter deals with the following UI applications and offers insights on making the best of this incredible FreeBSD software.

- 1. Browsers
- 2. Productivity
- 3. Document Viewers
- 4. Finance

Now we will study how to install and start using this essential UI software for managing daily tasks.

Installation of these features is done using ports or packages that are available online or via source code compiling. And then a window application for managing the use of this software to run them smoothly.

Browsers

The FreeBSD Operating System (OS) does not come with a browser bundled. In true open source style, you have to select everything you want, and custom built a PC and OPS that's built with you and your requirements in mind. Installing browsers can be done via package or compiling source from the ports method.

Here is a list of the most popular FreeBSD browsers, resource information, ports installation, and remarks, respectively.

Modern Day Browsers
