

Note: For heavy resources, it may take longer to compile the source code from the ports or has major dependencies after the installation.

While GNOME and KDE desktop versions have their HTML browser for managing online activities, you can also configure them as a complete desktop environment to use them as required.

Browsers are the key for using the internet

Firefox

Mozilla Firefox is among the most popular web browsers that uses the Gecko layout engine in rendering pages to implement standard HTML web standards. Firefox is packed with incredible features of smooth functionality, popup blocking, enhanced security, and extensions.

Here is the syntax for installing the Firefox latest version:

- `# pkg install firefox`

And for the Extended Support Release (ESR), you can use this syntax:

- `# pkg install firefox-esr`

You can also use the ports collection to compile any preferred version of the Firefox browser from the available source code. The following syntax can then be used for any ESR or specific local version for installation.

- `# cd /usr/ports/www/firefox`
- `# make install clean`

Konqueror

Konqueror is a fully-featured web browser with an additional multimedia server and file manager. Konqueror uses its in-built KHTML and also supports a modern Webkit for a complete browser engine.

You can install Konqueror using the following syntax in general:

- `# pkg install konqueror`

Similarly, you can also use the following syntax for installing Konqueror from the ports method:

- `# cd /usr/ports/x11-fm/konqueror/`
- `# make install clean`
