

Chromium

Sponsored by Google, Chromium is an open source project that offers a more reliable, safer, and highly stable web experience. Chromium code has been used in several top modern browsers such as Chrome, Opera, and Microsoft Edge. Important features include a minimalist user interface, tabbed browsing, numerous extensions, popup blocking, and so on.

Here is the code for installing Chromium browser:

- `# pkg install chromium`

Similarly, you can also use the following code to compile the source code via the Ports collection.

- # cd /usr/ports/www/chromium
- # make install clean

Productivity

Operating systems give numerous additional productivity options starting with word processor services or a complete office suite. As there are no default packages in FreeBSD OS, you can have several options to run on your system to handle daily activities productively.
