LibreOffice	Mid-Heavy	Huge	Gtk+, or KDE/GNOME, or JDKTM

Calligra

Calligra is another popular graphic art office suite developed by KDE. Calligra offers a number of standard components for enhancing productivity with Words as the word processor, Karbon as a graphical component, and stage as slide presentation including support for database and vector graphics as well.

Here is a syntax for the Calligra package to install on your FreeBSD operating System.

- `# pkg install calligra`

And the following code can be used for working with Ports Collection.

- `# cd /usr/ports/editors/calligram`
- `# make install clean`

AbiWord

Written in C++ and based on GTK+ 3, AbiWord is a highly user-friendly and popular word processor. AbiWord has similar features as Microsoft with amazing import and export for numerous file formats for a specific use.

The following code can be used seamlessly for installing the AbiWord software.

- `# pkg install abiword`

Here is the syntax for installing AbiWord via the Ports method:

- `# cd /usr/ports/editors/abiword`
- `# make install clean`

The Gimp

GIMP stands for GNU Image productivity program used for retouching images or image editors. GIMP is a versatile application with features
