

is a package management system that enables seamless installation of software packages.

This chapter will discuss how to configure sound cards, audio and video playback, and image scanners on FreeBSD systems. We will also discuss various applications that can be used for the configuration process.

After reading this chapter, you will know how to:

- Set up a sound card.
- Playback audio files such as MP3, WAV, and others.
- Encode audio files.
- Troubleshoot sound set up problems.
- Configure an image scanner.

Before proceeding further, you must know how to install applications on a FreeBSD system using the FreeBSD Ports Collection.

How to setup a sound card in FreeBSD

FreeBSD supports a plethora of sound cards. Before beginning with the sound card configuration process, you must know the sound card model details and the chipset. Similarly, you should also know whether the sound card is a Peripheral Component Interconnect (PCI) or an Industry Standard Architecture (ISA) card. FreeBSD supports both types of cards. You can check the list of compatible cards [here](#). You will also be able to check which driver supports your card, making the set up easy.

The setting-up process

First, you will need to load the compatible driver to use the sound device.
