Testing Audio on FreeBSD

Testing

Now that you have loaded the required module, you need to reboot into the custom kernel. The sound card should appear in your system message buffer, something like:

- `pcm0: <Intel ICH3 (82801CA)> port 0xdc80-0xdcbf,0xd800-0xd8ff irq 5 at device 31.5 on pci0`
- `pcm0: [GIANT-LOCKED]`
- `pcm0: <Cirrus Logic CS4205 AC97 Codec>`

The output will vary depending upon the sound card. If everything is set up and configured correctly, you can be sure that the sound card is functioning properly. If not, you will encounter an error message. Some common error messages include:

Error	Solution
"sb_dspwr(XX) timed out"	The I/O port is not set correctly.
"bad irq XX"	The IRQ is set incorrectly. Make sure that the set IRQ and the sound IRQ are the same.
xxx: gus pcm not attached, out of memory	There is not enough available memory to use the device.

MP3 audio

There are various MP3 players available on FreeBSD, such as Audacious. The audio/mpg123 port provides an alternative, command-line MP3 player. It can be run by specifying the sound device and the MP3 file.
