USB audio device on FreeBSD

First, you need to install the graphics/sane-backends port. Next, to check the scanner detection by the SANE system, use the `sane-find-scanner` command. The output will display the interface type and device node.

Next, you need to check if the frontend identifies the scanner. The `#scan-image - L` command can be used to check whether the scanner is detected. If the scanner is not recognized, you will receive a message stating the same.

Providing other users access to the scanner

You need to have read and write permissions to use the scanner. You can use the wheel and operator groups to provide access to the scanner. However, this is not recommended for security reasons. You can, instead, create a group and make the scanner available to it.

For example, `# pw groupadd usb` will create a new group called usb.

Then, you need to make the symlink and device node accessible to this group. You need to add the following lines to the `/etc/devfs.rules`:

- `[system=5]`
- `add path ugen0.2 mode 0660 group usb`
- `add path usb/0.2.0 mode 0666 group usb`

Finally, add the users to the group with the following command:

- `# pw groupmod usb -m vik`

Conclusion

In this chapter, we covered various aspects related to multimedia audio files and image scanners. We learned how to enjoy music and other audio on your FreeBSD system by configuring the hardware and the software
