

- **c:@:** link to drive c
 - **z:@:** root directory link
3. **drive_c/:** simulates drive C as it appears on existing Windows systems.
 4. **system.reg:** Contains Windows installation related information (similar to drive_c)
 5. **user.reg:** Current user's configuration information.
 6. **userdef.reg:** Default configurations set for new users.

• Creating WINE Prefixes

WINE will create a default prefix with all the registries mentioned in the previous section after installation, you can also manually create multiple prefixes. Creating multiple prefixes is useful to simulate a different Windows environment. It is required to run software that is not compatible with the standard environment. To create a WINE prefix from the command line, use the below code:

- `% WINEPREFIX="/home/username/.wine-new" winecfg`

This will initiate winecfg, which can be used to configure WINE through graphical user interface. Once you have created the prefix, you can use it like this:

- `% WINEPREFIX="/home/username/.wine-new" wine program.exe`

• Configuring WINE Prefixes Using “winecfg”

As mentioned, winecfg allows you to configure WINE through GUI. There are a total of seven tabs available in winecfg. Here's the list of all the tabs.

Different tabs available in the winecfg GUI tool.
