

1. **Applications:** Contains all the applications of a particular Windows environment. You will find default settings. You cannot remove these default settings. However, you can add or delete other applications and their settings from this tab.
2. **Libraries:** You can add new or existing overrides to default open-source libraries installed with WINE from this tab.
3. **Graphics:** As the name implies, this tab contains graphics-related options such as screen resolution, mouse capturing, virtual desktop, and window manager.
4. **Desktop Integration:** Here, you will find themes and some other visual options. You can also allow managing MIME file types internally and map multiple directories from this tab.
5. **Drives:** This tab shows links between FreeBSD directories and Windows drives. You can add and link new drives here.
6. **Audio:** As the name gives it out, this tab provides some audio setting options.
7. **About:** This tab gives brief information about WINE.

Additional WINE GUI tools

While the `winecfg` allows GUI configuration for optimising Windows environments, some additional management GUIs can help you out. However, there are numerous management GUIs, and we cannot cover all. Hence, we will be talking about the two most popular ones: Winetricks and Homura.

• Installing and Using Winetricks

Winetricks has some preset environment settings and DLL libraries that can help run certain applications smoothly. Winetricks is maintained on Github and not internally in WINE. You can install Winetricks in FreeBSD through the following code:

- `# pkg install i386-wine winetricks`

You can also compile it by using the below command:

- `# cd /usr/ports/emulators/i386-wine`
- `# make install`
- `# cd /usr/ports/emulators/winetricks`
- `# make install`

Once installed, you can use Winetricks by writing the following code:

- `% winetricks`
