Installing and using Winetricks for preset optimised Windows environments.

This will open a dialogue box with multiple options, such as install an application, benchmark, and game. You can also create a new wineprefix, enable silent install, and remove applications. All you need to do is select the option you want to go ahead and then follow the instructions and options.

• Installing and using Homura

Like Winetricks, Homura is also a program used to directly install applications, optimise Windows environments, and add libraries. Use the below command to install Homura from the terminal:

- `# pkg install homura`

You can also install it from ports, as it is maintained internally by the WINE program. Write the below code to install from ports:

- `# cd /usr/ports/games/homura`
- `# make install`

Once installed, you can type the following command to use Homura similar to Winetricks:

- `% Homura`

This will run Homura, and you can then interact with the dialogues on the screen to install, run, and remove multiple applications and libraries.
