

Installing and using Homura to run Windows applications.

You can install and use Winetricks and Homura simultaneously. However, the only thing to take care of is not providing them with access to a single prefix simultaneously. Both the management GUIs override default settings and alter registries to optimise Windows environments. Hence, using a single prefix simultaneously may lead to overwritten settings of one solution over another and cause failure.

Use a WINE prefix simultaneously

FreeBSD allows many users to log in and use a program simultaneously. But Windows does not allow this. It allows setting up several user accounts, but only a single user can use the system at a given point in time. Hence, WINE provides two strategies to overcome this issue.

● Installing Applications from the Same Drive

The first strategy is to allow many users to use a prefix, and thus the Windows environment simultaneously is by installing the application in a common drive. You need to create a drive and provide each user with access to the drive. Finally, add the drive's location to the user's prefix through the winecfg tool. This strategy is useful only if you need to share a few applications. However, if you want to share many applications, the next plan will help you out.

● Use a Common WINE Installation

This strategy requires you to create a new user for storing WINE prefixes
