

of your server to engage with each other. For voice channels in Discord, you will find a separate option called voice channels in the channel list. In the sidebar, click the + symbol next to the voice channel option. Here, select Voice Channel again. Now, name your channel and click on Create.

Voice channels also allow for loads of customisability. You can have multiple categories of voice channels and assign permissions to different users based on their eligibility. For example, you can have a separate voice channel using which the competitors in a tournament can speak with each other while playing, and a different channel through which other users can hear this discussion but not participate in it. This accessibility can be modulated based on the permissions you grant to users.

An accompaniment to voice channels is the ability to cast your screen in the Discord user interface. This can have loads of advantages when it comes to gaming. The tournament can be cast at the same location where the voice channel is active, leading to a much more well-rounded viewing experience. Besides, viewers do not have to switch between screens and can continue viewing the rest of their channels alongside the tournament. The quality of the video can also be fine-tuned in Discord in case of connectivity issues.
