

formatting text by enclosing them between particular characters like asterisks or tildes before and after the text. WhatsApp has an in-built Markdown parser that allows users to format text with some sweet styles. This article is for beginners and people who have used Markdown unknowingly but may not know the full syntax and the things that can be done. For starters, Markdown is a lightweight markup language with a plain text formatting syntax. A markup language used in blogs and instant messaging apps due to its quite appealing source code.

What exactly is Markdown?

What exactly is Markdown? Why do we use it, and how do we use it? Well, in simple terms, it is a plain text formatting system for styling your sentences.

Markdown is a text to HTML conversion tool for web writers. So, Markdown allows us to read using an easier-to-read, easier-to-write plain text format and then convert it structurally to valid HTML. With this definition, Markdown is essentially two things. It's a plaintext formatting syntax, and two, it's a software tool written in Perl that converts plain text formatting to HTML. The overall design goal for markdown formatting syntax is to make it as readable as possible, create a text that looks dead simple and transform it into stylised output. Even though there are no formatting tools in Discord visible, Discord uses Markdown for formatting.

Markdown Markup Language

Now, many of us have used different tools that allow us to format text in various ways. Google Docs is an excellent example of that. It is instrumental in providing multiple tools to format and edit the text, but it may often be overdoing it. Perhaps, you just want to bold some text or make a simple list, and maybe you don't even want to open Google Docs to format a text that you are going to email.

CODE:

- `<!DOCTYPE html>`
- `<html>`
- `<title>HTML Tutorial</title>`
