

the number of hashes corresponds to the heading level. So, if we want to create a heading level 3, we use three hashtags (###). For different types of emphasis, other punctuation marks are used. If you are going to italicise your text, you simply add an asterisk (*) before and after the word. To make it bold, add two asterisks (**) before and after the text, and if you want to have some strikethrough text, you simply wrap the text in two tildes (~) before and after. For list items, we also have a pretty simple syntax we can use to create an unordered list, for which you are given the option of using dashes (-), an asterisk (*), or plus signs (+) to put them in front of line items which will create a bulleted list. For ordered lists, all we need to do is simply add line items with numbers followed by periods (.). Now the numbers don't have to be in numerical order, but the list should start with number one (1), creating a numbered list. Now that we know how Markdown is composed let's dig in a little deeper and figure out how exactly it works.

How does Markdown work?

Markdown is plain text so that it can be used almost anywhere. But in this case, let us assume you wrote a file that has some markdown syntax. From there, you are going to make sure that you save it with an extension called markdown or dot MD. Going from there, once you have your markdown file, you need a markdown application that's capable of processing it. Mark-
