

down applications use a markdown processor, also commonly referred to as a parser or an implementation, that takes the Markdown-formatted text and now puts it to HTML format. Directly at that point, your document can be viewed in a web browser or combined with a stylesheet and printed.

Sugar styles and code blocks

For different types of emphasis, other special characters are used, in some cases, multiple at once. We use underscores (`_`) for underlining text; however, using one underscore before and after the text will italicize it, and using two (`__`) will highlight the text. Similarly, using two asterisks (`**`) will bolden the text, but three (`***`) will bolden and italicize it. Adding two tildes will add a strikethrough text. However, those who do not wish to use Markdown can stick to adding a backslash (`/`) in front of their statement or insert messages in a code block which helps escape the Markdown formatting. Spoilers are a kind of Markdown, too, that hides text until clicked on. Using two pipes (`||`) hides text behind a black rectangle.

Code Blocks is an open-source integrated development environment. Discord supports code blocks and enables users to create their code blocks by wrapping text in backticks before and after. Using three backticks creates multiline code blocks making Markdown more fun. However, those looking to spice up their code blocks can denote a specific language for syntax highlighting by simply typing the name of the language one wants the code block to expect after the first three backticks. Know that each language has its approach to highlight-able syntax, which sadly cannot be done on the mobile app.

Why Markdown?

Well, there are a few reasons for that. One of them is accessibility. Markdown is very accessible to someone who doesn't know the first thing about HTML. It can get quite messy and complex at times. Moreover, if you have a lot of content, it can become quite nested and can be very hard to read, especially if you are not familiar with HTML. This leaves us with a lot of room for error HTML. Typos, so even a minor typo or mistake can completely alter and change the way content looks. One of the other reasons for using Markdown is that we can pretty much use it everywhere due to the way it's written. For example, it is used widely in software documentation, particularly open source, because it enables richer formatting than plain text. Alone-specific applications
