

Administrator permission

The administrator permission is the foremost permission you can grant to any user on your Discord server. The administrator permission grants a user all the permissions available for your server. These permissions are awarded together for all channels, and once a user has been made an administrator, it is not possible to implement channel-specific permissions.

Hence, it is important that you grant administrator permission only to trusted users and only if they need permission. This is particularly essential as administrators can not rescind permissions from other administrators. When granting a user administrator permission, it is especially worth considering if granting every other permission to the user in the channels that the user operates can serve the purpose. If the user requires permission only for a couple of tasks, it is much safer to only grant the permissions for the purposes required instead of making the user an administrator.

While granting the administrator permission to other users must be done with care, granting such permission to a bot must be done with utmost caution. Discord bots automate various different tasks on your Discord server. Discord bots with the administrator permission can potentially grant this permission to other bots and users, delete all the channels you have created, add or remove users, remove the emotes and roles on your various channels and destroy months' worth of work that you might have put into it.

While stable bots and bots from large developers will basically never do this, lesser-known and nefarious bots can often disguise themselves as utilities and wreak havoc on your channel once you grant them the right permissions.
