

When dealing with bots, make sure that the bot is stable and trust the bot's developers before you go forth and grant a bot administration permission.

Types of administrator role permissions

There are several roles permissions in Discord that can grant a user or bot administrative functionality. Several of these roles will allow user access to only one particular function. In general, if administrators require any form of two-factor authentication to enter your server, these permissions will be automatically disabled. There are multiple permissions for which this rule applies. Some of these permissions are administrator permission, managing the server, managing channels, managing roles, managing messages in a server, kicking members of a server, and banning members from a server.

Roles in Discord

Context Menus

A significant proportion of server administrators in Discord will use bots for the moderation of a channel or server. However, if you choose to manage your channel by yourself, you can do so with the help of context menus. The following context menus help you manage your server.

Server settings

The server settings allow you to configure the whole server. This includes
