

all the channels included in the server and all the members of the server. The options available to you in this section depend considerably on the permissions granted to you as a moderator. They also depend on whether your server is verified or has Boosts.

To access server settings on the desktop, you can right-click on your server's name and then click Server Settings from among the given options. To do so on mobile, you need to first tap on the name of the server. Now, tap on the Settings option on the bottom right.

The following are the main menu options available in server settings.

1. **Overview:** In the overview option, you can change the name and region of the server. You are also permitted to establish system messages and change notification settings for these messages. At Boost Level 1, you are also allowed to change the server invite background. It is also possible to set an AFK voice channel through server settings. To access the overview, you need permission to Manage Server.
2. **Roles:** This option makes it possible to act as an administrator for roles. However, you can only affect roles that are inferior to yours. Apart from assigning roles to members and taking them away, this option also makes it possible for you to reorder and delete roles. To access this option, you need to have the Manage Roles permission.
3. **Emoji:** This option makes it possible for you to add new emojis to the current roster of the server, delete an emoji from the roster, and also edit the names of emojis that are present. To access the Emoji option, you require the Manage Emojis permission.
4. **Moderation:** The Moderation option allows you to set the verification level of the server. It also makes it possible for you to customise the explicit media and language content filter. For the Moderation option, you require the Manage Server permission. If you are the owner of the server, you can also enable two-factor authentication for the moderators of your server.
5. **Audit Log:** The audit log of a server is a chronological log of all the moderation activity that has been carried out on a server and the moderators who have carried out this activity. Once an activity has entered the audit log, it is not possible to edit or delete it. The audit log is generally used for verification of moderator actions. It is also used for addressing technical issues that arise as a result of these actions. All moderators do not have access to the audit log, and you require the View Audit Log permission for it.
