

1. **Manage Channels:** The permission to Manage Channels allows you to edit channel settings. You access these settings by hovering over the channel name on Desktop and clicking on the gear icon. On mobile, you can tap on the name of the channel and subsequently tap on Settings. You can change the name of the channel, the permissions of the channel, implement slow mode, or even delete the channel.
2. **Mention @everyone, @here, and All Roles:** If you have this permission, you can mention all the users on a channel, all the online users on a channel, or all the users of a particular role even if that role does not allow everyone to mention it.
3. **Send TTS Messages:** Here, TTS stands for text to speech. When you send TTS messages on a channel, the message is read aloud to everyone by Discord.
4. **Priority Speaker:** When you grant a user Priority Speaker permission on a voice channel, the volume of all the other users in the channel will be reduced when this user speaks.
5. **Read Text Channels:** This permission allows users to read the messages on a particular channel, even if they aren't allowed to message.
6. **Embed Links:** This permission allows there to be a preview of the links sent by a user. If this permission is not granted, the link can still be posted, but a preview will not appear.
7. **Attach Files:** Users who are granted this permission can upload files or media to the server.
8. **Read Message History:** If users are granted this permission, they can read all the messages that were sent on the channel when they were not online. If it is disabled, users will only be able to see messages posted when they were on the channel and not offline or on another channel.
9. **Use External Emoji:** Any user who has Discord Nitro can be permitted to use emojis from one of their other Discord servers.
10. **Add Reactions:** Members with this permission can add new reactions to a message.

Technical considerations

A common demand of many users and channel owners in Discord is the capability to mute users not just in voice channels but also in text channels. However, there is no permission that allows you to ensure the same. This can be done by using a bot. A bot creates a new mute role that prevents individual members from sending messages in a text channel and assigns
