

soon as a conversation is started. But stop right there; there is no need to be so instinctive about it. Before you add any moderator, make sure that you have already gained trust on that account. Also, when you add moderators to your community, make sure you don't fill a lot of them. This is a step-by-step process and it needs time to do things in the right way. Initially, add 2-3 moderators to your community, so that you are able to cover all the time zones and your server is never quiet. According to experts, an ideal community consists of 1 admin per 10 moderators, and 1 moderator per 1000 members. It is always better to stick to this ratio.

- A big no-no is rewarding people if they bring people to your server. You should also refrain from all unsolicited advertisements. Remember not to advertise to any random person or on any random server. Doing anything of this sort means that you are breaking Discord's terms of services. So, if you or any member of your community encourages others to do so, you are breaking the ToS of the application. This can lead to banning your account or shutting down your server.
- If you are not an admin, think twice before joining a server about why you want to join that server. If you are doing something that others are doing, then you need to hold on for a second and think. Make sure all the decisions that you take are yours, and not under the influence of any other.

Setting up user roles is also important

There are several roles in Discord, such as admin, moderator, members, and so on. All these roles are important in many ways, one of which is getting permission. Various roles in the application give the user rights and easy permissions. Every stage or hoisted role can be given a task to execute, such as the moderators can get access to delete messages, or ban users if they misbehave with others. Whenever roles are assigned to users, they inherit the responsibilities and permissions. Doing this saves a lot of your effort and time, because now you don't have to assign these responsibilities one by one. All you have done is assign the roles to the users and these permissions go to them automatically. Also, you can use these roles to give your friends some cool ranks or colours.

Firstly, when you "display role members" separately, they show up on your user panel in their own category. This will help you understand and determine the users that have roles assigned. Letting the setting turn off is a neat trick that can help you in assigning some roles; for e.g., if you have a few admins in your community, you can choose a different colour for them and assign a name that is above their rank. But when you do so, let
