

2. Customise the roles

Once you have done the setup, the next task for you is to assign roles to the members who are connecting with you. That will happen when you will be in the server settings. There you will be able to see a clickable button that says, “roles.” As soon as you do that, a plus sign will pop up on your screen. This is also a clickable button, and when you click it, you will be able to create new roles. Then down on the same screen, you will get several options; these will be the functionalities of roles a member will have.

Every role has customisable permission in a channel, and every role carries a customized name with itself. There are several names that can be used here, including community manager, admins, mods, server guides, helpers, etc. You will have to sort things step-by-step and establish all the roles. Once you are done with that, the next step includes creating a channel.

3. Channel creation

On the left side of your screen, there will be a list of channels, including audio channels. There are some customised channels that certain admins create. However, if you wish to use the standard channels, you can choose from announcements, general channels, rules, private channels and some extra channels that depend on the nature of the community. In each section of channels, there will be a plus sign made in front of it. When you click on that, you will be able to create your channel for your community. Upon selection of the channel type, give it a name. Everything, right from the channel name to your profile image, everything should resonate along well so that people don't confuse much amongst them.

When you customise the roles, it gives permission to the members to use their power.
