

Introduction

Discord is one of the fastest-growing text and voice-based messaging applications in the world. It is among the most highly customisable chat applications and is primarily aimed at gamers. Discord allows you to set up multiple channels on the same server. Using these channels, you can talk to different members of your server about different topics through voice or text. Discord also contains an array of bots that allow you to automate various tasks on the platform.

The basic unit of all activity carried out on Discord is known as a server. A Discord server may be considered an overarching group in which activity related to server different topics takes place. Discord channels are a part of a server and the locations where conversations are hosted.

The primary customisability of Discord comes in the form of roles and responsibilities. You can assign various roles to every user and manage the amount of access they get to the server. This allows you to tailor the conversations that happen on a channel and ensure that guidelines are adhered to. Bots are also of great use in moderating these channel conversations.

In this chapter, we will be discussing how a Discord server is set up. These steps will help us establish a Discord server from scratch and various channels in it.

Creating a Discord server

The first step toward carrying out conversations on a Discord channel is creating a Discord server. This can be done either on the desktop app or the mobile app and even through the web interface of Discord.

To start with, you will need to create a free account on Discord. This can be done using your email. Once you have created your account and verified it, you can sign into the account. After signing in to Discord, you will be asked to either create a server or join a server. Here, you need to opt for creating a server.

If you are already a Discord user but have only used it to join servers, you can click on the large + sign that you might see on the bottom left of your screen. You will be asked to create a server or join a server again. Choose the option to create a server.

On the next screen, you will be asked to give your server a name. Here, you can also add an icon for your server and the region that the server needs to be based on. In general, Discord will detect the region of your server automatically; if it does not do so, you may enter the region manually.
