Vue.js installation

Getting started with Vue.js

Before installing any new package, you need to follow several codes and commands. To execute the npm (Node Package Manager) and install Vue.js, you need to have administrator rights. You can install it on your system only when you have the version manager privileges from Node.js.

One of the leading frameworks, Vue.js makes it easier for the developer to work with the user interface layer.

The design of the build is incrementally adoptable. Thus, you can weave it easily into your project according to its requirements.

Basically, there are four ways in which you can add Vue.js:

1. Have it imported on the system as a CDN package
2. Host the downloaded JavaScript files.
3. Use npm (Node Package Manager) to install it.
4. Scaffold the project using the official CLI (Command Line Interface).
