

Runtime and Compiler vs. Runtime-only

You will need the full build with the compiler if you want to bundle the templates on the client. This includes using the DOM HTML element for its mounting in a template, passing a string to the option with the template.

```
• // this requires the compiler
• new Vue({
•   template: '<div>{{ hi }}</div>'
• })
•
• // this does not
• new Vue({
•   render (h) {
•     return h('div', this.hi)
•   }
• })
```

During the build time, JavaScript compiles the files beforehand while you use the vueify or vue-loader. You can use the compiler only in the runtime-only build as you do not need it in the bundle for the final release.

Webpack

```
• module.exports = {
•   // ...
•   resolve: {
•     alias: {
•       'vue$': 'vue/dist/vue.esm.js' // 'vue/dist/vue.
common.js' for webpack 1
•     }
•   }
• }
```

Rollup

```
• const alias = require('rollup-plugin-alias')
•
• rollup({
•   // ...
•   plugins: [
•     alias({
•       'vue': require.resolve('vue/dist/vue.esm.js')
•     })
•   ]
• })
```
