

- In Vue.js you can output any data value using parentheses

```

• <template>
•   <p>{{ count }}</p>
• </template>
•
• <script>
•   export default {
•     data() {
•       return {
•         count: 1
•       }
•     }
•   }
• </script>

```

This one property can host some small computations like:

```

• <template>
•   {{ count * 10 }}
• </template>

```

But in computed properties, you remain limited to the single Javascript expression.

In addition to this limitation, it should be noted that templates should be concerned with data being displayed to the user instead of performing logic computations.

To have declarative templates and do something more with the single expression, you use computed properties.

Computed properties are defined in the Vue component.

```

• <script>
•   export default {
•     computed: {
•
•     }
•   }
• </script>

```

- Example of Computed Property

In the example code of the computed property, use **count** to calculate the output. Here:

1. You don't need to call **count()** as Vue.js automatically calls on the function.
2. You can use a regular function like the one used here (if not an array
