

```

• <template>
•   <p>{{ now }}</p>
• </template>
•
• <script>
• export default {
•   computed: {
•     now: function () {
•       return Date.now()
•     }
•   }
• }
• </script>

```

It will render once but will not re-render or will not even update. Refresh just on the page when the Vue component is reinitialized.

• The online expressions involving Vue.js' are more convenient.

Vue.js' inline expressions are very convenient. You should use computed properties for more complicated logic. A computed property is used to describe a declarative value that further depends on other values. When you do data- bind to a computed property within the template, Vue knows when it is rendered to be updated where any of the values depending upon the computed properties have been changed. This turns out to be very powerful. The codes are more declarative, easier, and data-driven. Often, it is a better idea to use computed properties instead of imperative **\$watch** callback.

```

• var vm = new Vue({
•   data: {
•     firstName: 'Foo',
•     lastName: 'Bar',
•     fullName: 'Foo Bar'
•   }
• })
•
• vm.$watch('firstName', function (val) {
•   this.fullName = val + ' ' + this.lastName
• })
•
• vm.$watch('lastName', function (val) {
•   this.fullName = this.firstName + ' ' + val
• })

```
