

Let us again consider this example:

```

• <div id="demo">{{ fullName }}</div>
• var vm = new Vue({
•   el: '#demo',
•   data: {
•     firstName: 'Foo',
•     lastName: 'Bar',
•     fullName: 'Foo Bar'
•   },
•   watch: {
•     firstName: function (val) {
•       this.fullName = val + ' ' + this.lastName
•     },
•     lastName: function (val) {
•       this.fullName = this.firstName + ' ' + val
•     }
•   })

```

The above code is repetitive and imperative. You can compare it with a computed property version:

```

• var vm = new Vue({
•   el: '#demo',
•   data: {
•     firstName: 'Foo',
•     lastName: 'Bar'
•   },
•   computed: {
•     fullName: function () {
•       return this.firstName + ' ' + this.lastName
•     }
•   })

```

● Computed Setter

Computed properties use default **getter-only**, but you can also provide it a **setter** when required:

```

• // ...
• computed: {
•   fullName: {
•     // getter
•     get: function () {
•       return this.firstName + ' ' + this.lastName
•     },
•     // setter

```
