

Class and Style Bindings

When modifying an element's class list and inline styles, data-binding is required.

Introduction

Data binding is often used to manipulate an element's class list and inline styles. Due to the fact that they are both attributes, we can manage them using `v-bind`: we just need to evaluate a final string using our expressions. However, tinkering with string concatenation is inconvenient and vulnerable to error. As a result, Vue offers additional benefits when `v-bind` is used in conjunction with class and style. Along with lists, expressions will evaluate to objects and arrays.

Vue.js is a framework for developing User Interfaces (UIs) and Single-Page Applications (SPAs) (SPAs). It's simple to understand how to use Vue.js and the framework of liberty and convenience that comes with it while designing software in this program, since it combines the best aspects of
