shortcut syntax for v-bind

What's really cool is that you can also provide a component of both static and dynamic classes.

This enables you to provide static classes for items that are certain to remain constant, such as positioning and structure, and dynamic classes for your theme:

```
<template>
  <span
    class="description"
    :class="theme"
  >
    This is how you add static classes in Vue.
  </span>
</template>
```

```
export default {
  data() {
    return {
      theme: 'blue-theme',
    };
  }
};
```

Copyright Attribution:

```
.blue-theme {
  color: navy;
  background: white;
}
```

Classname applied

In this instance, theme refers to the variable containing the classname to be applied (remember, it's treating it as Javascript in that case).
