

## Binding in the Vue Style

Vue.js's **v-bind:style** and **v-bind:class** directives allow dynamically binding styles and classes to elements.

Consider the following scenario: we want to dynamically change the font size or margin of some feature depending on user feedback. With **v-bind:type**, Vue offers interactive style binding. Consider the following data model as an illustration.

```
data() {
  return {
    margin: 20
  }
}
```

Dynamically changing margin

Let's build a sample with two buttons and an inline expression that increments and decrements the margin variable on the click event:

```
<button v-on:click="margin++">
  Increase margin
</button>
<button v-on:click="margin--">
  Decrease margin
</button>

<p v-bind:style="{ margin: margin + 'px' }">
  Margin is: {{ margin }}
</p>
```

Building a sample

Following the keys, we have a paragraph with a **v-bind:style** tag. This assigns the value of the margin variable to the CSS margin property.

Note : camelCase would be converted to dash-case syntax in this case (ie: fontSize to font-size).

Rather than include all styles in the inline expression, we should hold
