

a style object in the model and use it in conjunction with the **v-bind:style** directive.

Multiple styles array | Binding

If several type objects need to be added to the **v-bind:style** directive. We may have the following type artifacts in the data model:

```
basicStyles: {
  fontWeight: '800',
  color: 'red'
},
extraStyles: {
  color: 'blue'
},
```

multiple style array

Prefixing Automatically

Referring to cross-browser compatibility. Vue automatically adds the appropriate vendor prefixes to assist in maintaining a clean syntax. With prefixes such as **-moz** or **-webkit**.

Dynamically Creating Binding Classes

Direct styles are not the safest technique, and they may become complicated when criteria shift. To our rescue, the **v-bind:class** directive enables us to associate classes with any variable.

For instance, when a todo item is chosen, the color and font-weight will need to be changed.

Notice the same data model.

```
data() {
  return {
    selected: 'item 1',
    items: ['item 1', 'item 2', 'item 3']
  }
}
```
