

When an object is pressed, the chosen variable's value is adjusted to equal the value of the currently selected item. With this in effect, we may use the **v-bind:class** directive to set the item's selected class if the selected variable is equivalent to the current item:

```
<div>
  <p v-for="item in items"
    v-on:click="selected = item"
    v-bind:class="{ selected: selected == item}"
    {{item}}
  </p>
</div>
```

v-bind class directive

Binding Multiple Classes

Similarly to how we implemented multiple styles using array syntax, we may also add multiple classes to an object via the **v-bind:class** directive by forwarding an array of classes.

The data model will describe the class list as follows:

```
data() {
  return {
    classes: ['selected', 'bolder']
  }
}
```

Multiple classes

This will add the element with both the chosen and bolder classes. When we modify the collection in the model dynamically, the modifications are immediately mirrored in the example.

Using v-bind to bind HTML classes and styles on a page

Syntax of Objects

To dynamically toggle classes, we may transfer an object to **v-bind:class**:
