Vue.js

isActive class

The preceding syntax indicates that the active class's existence would be calculated by the truthfulness of the data property **isActive**.

Multiple classes may be toggled by adding additional fields to the entity. Additionally, the **v-bind:class** directive may live alongside the standard class parameter. As an example, consider the following template:

```
<div
  class="static"
  v-bind:class="{ active: isActive, 'text-danger': hasError }"
></div>
```

Copyright Attribution:
Vue.js

Multiple classes

Additionally, the following data:

```
data: {
  isActive: true,
  hasError: false
}
```

Copyright Attribution: Vue.js

Adding data

It will produce the following:

```
<div class="static active"></div>
```

Copyright Attribution:
Vue.js

Output

When **isActive** or **hasError** updates, the class list is revised to reflect the adjustment. For instance, if **hasError** is set to true, the class list will be replaced with “**static active text-danger**”.
