

The Fast and the Feature-Rich

Web development has been through a tumultuous ride over the past two decades. From the initial days of Web 1.0 where web pages were painfully simple, we moved towards making them richer and more functional. The unfortunate downside of making richer web pages is that they tend to become bloated and don't run properly on a lot of devices. And the advent of mobile devices with expensive data plans meant that heavy pages would miss out on consumers if they didn't load on time or if it became too expensive to load. Google's own metrics state that you stand to lose a major chunk of visitors if your webpage doesn't load in under two seconds.

So now we're in an era where everything needs to load super quick and the websites shouldn't seem like they were designed before man discovered fire. And thus, lean frameworks were born. We've had several of those over the years. There's React, Angular, Glimmer and many more frameworks that have entered the market over the past 10 years with promises of building lean and performant web sites. However, making something lean shouldn't take away helpful features and modules that would have aided developers in rapid prototyping. And thus, the search for a framework that's not only lean but also allows for developers to build rich web sites began.

Vue.js is one of many such frameworks that lay claim to the throne of being the best. While that's very subjective, it can certainly be said that it's one of the better frameworks out there right now. Vue.js was built by Evan You who had worked on AngularJS at Google and he designed Vue.js with
