

It is not essential for the bound entity to be inline:

```
<div v-bind:class="classObject"></div>
```

```
data: {
  classObject: {
    active: true,
    'text-danger': false
  }
}
```

hasError

This would provide the same outcome. Additionally, we can attach an object to a computed property that returns an item. This is a frequent and effective pattern:

```
<div v-bind:class="classObject"></div>
```

```
data: {
  isActive: true,
  error: null
},
computed: {
  classObject: function () {
    return {
      active: this.isActive && !this.error,
      'text-danger': this.error && this.error.type === 'fatal'
    }
  }
}
```

Effective pattern

Array Syntax

To apply a collection of classes, we may transfer an array to **v-bind:class**:
