

```
<div v-bind:class="[activeClass, errorClass]"></div>
```

```
data: {
  activeClass: 'active',
  errorClass: 'text-danger'
}
```

Copyright Attribution: Vue.js

Array

This will render:

- `<div class="active text-danger"></div>`

If you choose to conditionally toggle a class in the set, use the following ternary expression:

- `<div v-bind:class="[isActive ? activeClass : '', errorClass]"></div>`

This would still add **errorClass**, but only **activeClass** when **isActive** is true.

However, if you have several conditional types, this may get very verbose. As a result, the object syntax may also be used within array syntax:

- `<div v-bind:class="[ { active: isActive }, errorClass]"></div>`

With Components

This section assumes understanding of Vue Components. You can skip it and come back later.

When you use the class attribute on a custom object, such classes are applied to the root element of the feature. This element's existing classes would not be overwritten.

For eg, if you declare this component:

- `Vue.component('my-component', {`
- `template: '<p class="foo bar">Hi</p>'`
- `})`

Then when you use it, add the following classes:

`<my-component class="baz boo"></my-component>`

The HTML will be:

- `<p class="foo bar baz boo">Hi</p>`

For class bindings:
