

- `<my-component v-bind:class="{ active: isActive }"></my-component>`

When `isActive` is true, the rendered HTML will be as follows:

- `<p class="foo bar active">Hi</p>`

Binding Inline Styles

Syntax of Objects

The object syntax for **`v-bind:style`** is simple - it almost looks like CSS, but it's a JavaScript object. For CSS property titles, you may use either camelCase or kebab-case (with kebab-case, use quotes):

```
<div v-bind:style="{ color: activeColor, fontSize: fontSize + 'px' }"></div>
```

```
data: {
  activeColor: 'red',
  fontSize: 30
}
```

v-bind style

To make the template smoother, it is always a good idea to attach directly to a style object.

```
<div v-bind:style="styleObject"></div>
```

```
data: {
  styleObject: {
    color: 'red',
    fontSize: '13px'
  }
}
```

Effective pattern

Once again, the object syntax is often combined with computed properties that return objects.

Syntax of an Array

You may add several type objects to the same element using the array
