

When **inStock** is **false**, our button is now disabled. However, this has little impact on the appearance of the button. In other terms, the icon seems to be clickable even though it is not.

Similarly to how we attached **inStock** to the **disabled** attribute of the icon, we can add a **disabledButton** class to our button if **inStock** is **false**. As a result, our icon would appear disabled.

```

25: <button v-on:click="addToCart"
26:       :disabled="!inStock"
27:       :class="{ disabledButton: !inStock }"
28:       >Add to cart
29: </button>

```

Vue mastery

Example code

The button is now greyed out when **inStock = false**.

```

27: :class="{ disabledButton: !inStock }"

```

Copyright Attribution:
Vue mastery

Example code

To attach to the class of our button, we use the **v-bind** directive's shorthand :

The inclusion of the **disabled-button** class is determined inside the brackets by the truthfulness of the data property **inStock**.

In other terms, the **disabledButton** class is introduced while our product is not in stock (**!inStock**). Since the **disabled-button** class uses a grey background colour, the button becomes grey.

We've used our new skill class binding in conjunction with attribute binding to disable and grayscale our button if our product **inStock** is **false**.

Conclusion

In this tutorial, we learned about different ways that we can style our Vue.js application using class and style bindings with multiple style arrays, v-bind, inline styles, object and array syntax. **d**
