

Design plays a significant role in website development and is one factor that determines how the visitors will accept the website. A website looks and behaves when people come and try to interact with the websites dramatically impacts them. Most people decide if they want to stay on a website or leave it within a few seconds of opening it. The reason is design. If the design of the web page they see is appealing, simple, and focused on the main goal, they will stay. If there are distractions, they might remain for some time, but eventually, they will leave, and they might not come back again. After React.js, Vue.js is the most loved framework if we believe StackOverflow.

Let's look at the reasons why a developer should choose Vue.js for web UI development:

- **Small Size Apps:**

The first reason why most people use Vue is because of the small size of its application. The size of the application is generally between 18-21 kBs, and that is considered to be reasonably small. Even though the size of the app is small, it doesn't affect its performance or speed, and that is why they are also the reasons mentioned below. Developers can choose this framework without any confusion for both small and extensive web development UI projects.

- **Easy To Learn:**

Developers who have never used Vue can learn how to use it quickly. The framework is easy to understand, and if the developers give it time and dedication, they can easily understand it. Also, with practice, they can get a hold of this. This is something that attracts a lot of UI developers towards Vue.js.

- **Better Performance:**

The applications and the interface created by the Vue are great. The reason behind this is that this framework allows the developers to avail excellent performance. Developers choose Vue because of this reason as well. The framework is capable of handling high frame rates.

- **Easy To Integrate:**

Because this framework is based on JavaScript, it is easy to integrate it with any existing application where integrated JS is possible. This feature of the framework helps the developers to create other applications from scratch and introduce the elements of Vue into it later.
