

As a result, we will resolve our current issue by modifying the second handler function in the previous code block to:

```
video.onclick = function(e) {
  e.stopPropagation();
  video.play();
};
```

Using StopPagation()

Preventing default behaviour

You can find yourself in a position where you want to prohibit an event from doing its default actions. A web type, such as a custom login form, is the most popular example. When you fill in the specifics and click the send button, the data is sent to a specific location on the server for analysis, and the window is redirected to a “progress alert” page of some kind (or the same page, if another is not specified.)

The problem arises where the user cannot upload the data correctly; as a creator, you try to avoid the data from being sent to the server and therefore display an error message that explains what went wrong and what needs to

```
<form>
  <div>
    <label for="fname">First name: </label>
    <input id="fname" type="text">
  </div>
  <div>
    <label for="lname">Last name: </label>
    <input id="lname" type="text">
  </div>
  <div>
    <input id="submit" type="submit">
  </div>
</form>
<p></p>
```
